ZOHO CREATOR REPORT

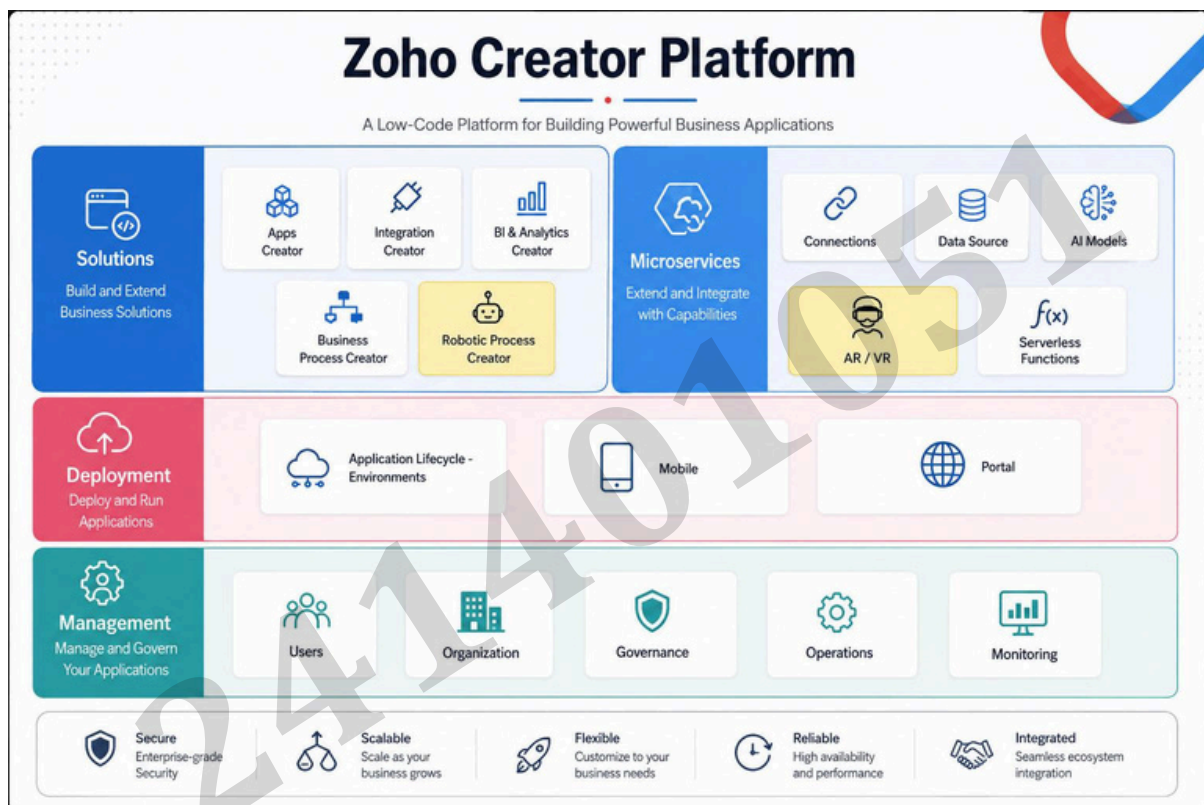

Setting Up a Zoho Creator Account: Exploring the Platform Architecture and Interface

Prepared By: Manishaa Karunamoorthy

Department: B.Tech CSBS

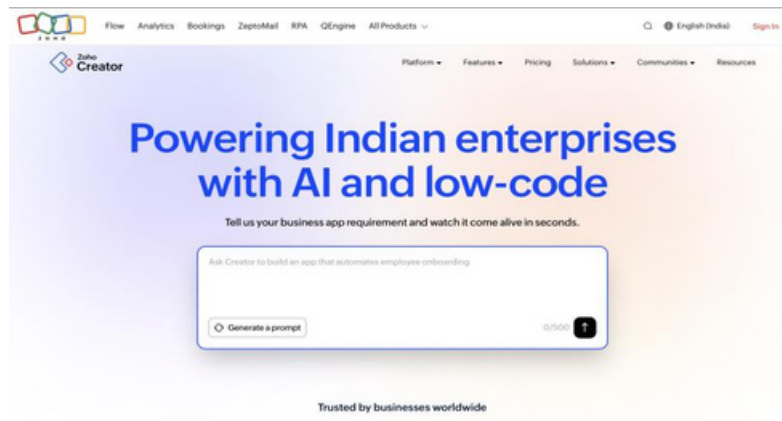

Roll Number: 241401051

ARCHITECTURE OF THE ZOHO CREATOR PLATFORM

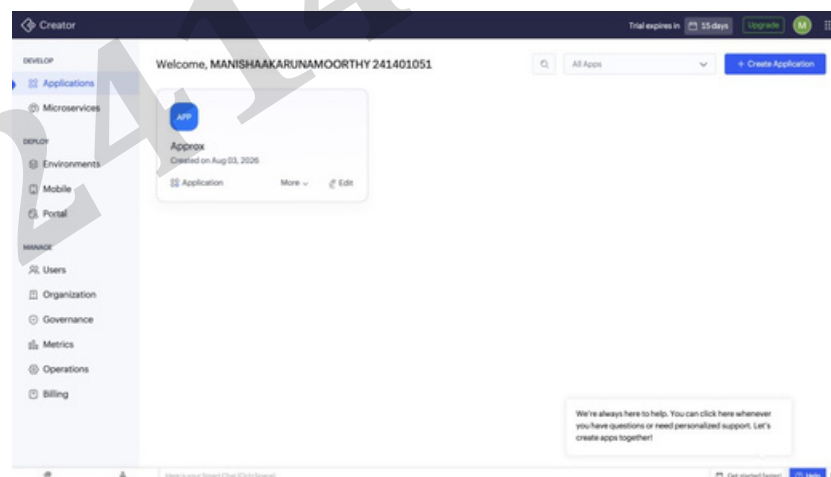

The Zoho Creator Platform follows a layered low-code architecture that enables rapid application development and deployment. It integrates application creation, business process automation, external services, and AI capabilities into a single platform. The architecture also provides centralized management, secure deployment, and scalable infrastructure, making it suitable for building modern business applications efficiently.

1. Zoho Creator AI Application Generator Landing Page

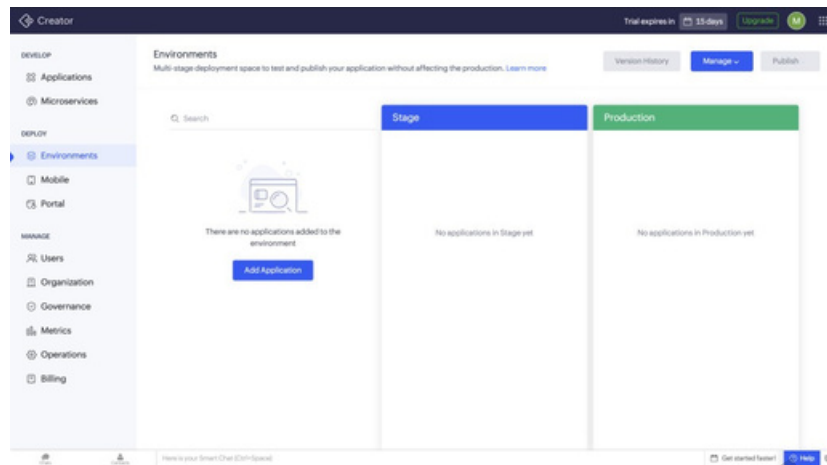

The **Zoho Creator Sign-In page** provides a secure authentication system for users to access their low-code applications. It allows users to log in using their Zoho credentials and ensures authorized access to the platform's development and management features.

2. Zoho Creator User Dashboard

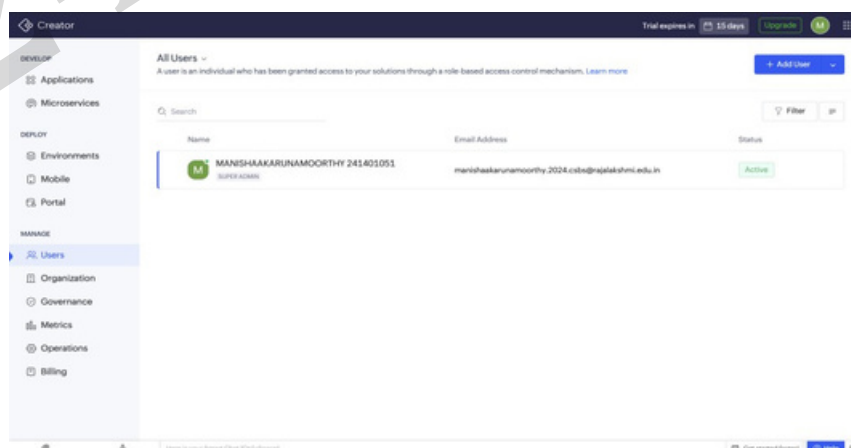

The **Zoho Creator Dashboard** acts as the central control panel for application development and administration. It allows users to create and manage applications, configure microservices, and access deployment and management tools from one unified interface. This improves productivity by providing a streamlined and organized development environment.

3. Multistage Environment Dashboard

The deployment layer delivers the application across multiple platforms, including web portals, mobile applications, and different deployment environments such as development, testing, and production. It ensures seamless accessibility, consistent performance, and secure application delivery while supporting scalability, continuous updates, and an optimized user experience across all devices.

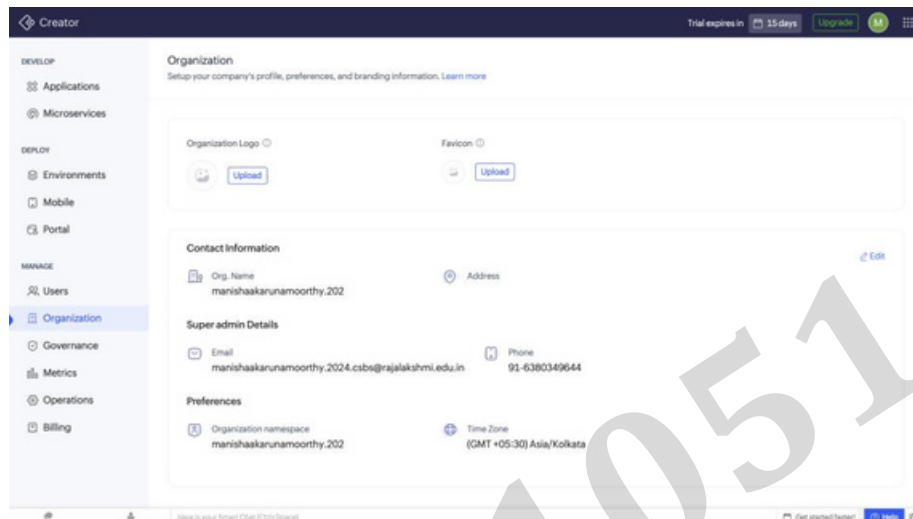

4. User Management and Role Based Access

The Users page is used to manage all users who can access the applications. Administrators can add users, assign roles, and control

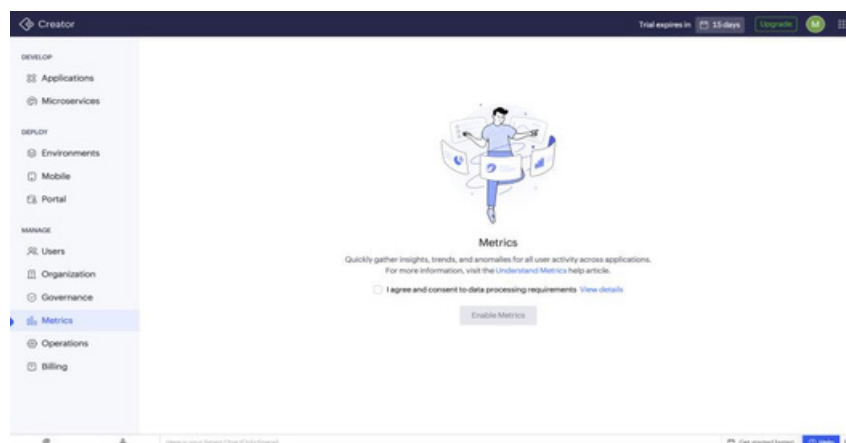

permissions based on responsibilities. This ensures secure and role-based access management.

5. Organization Settings and Profile Setup

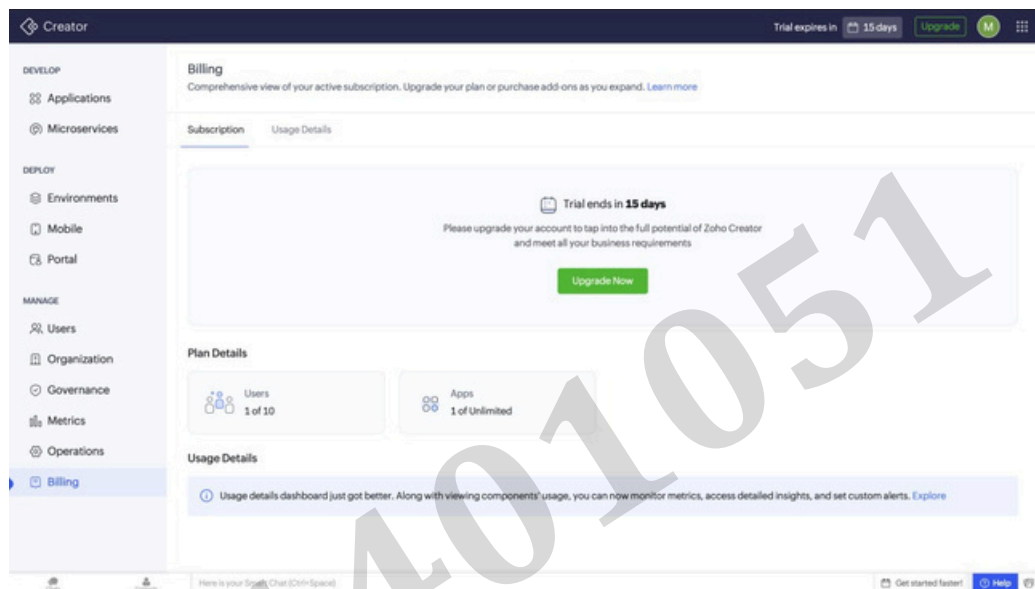

The Organization & Governance layer manages users, roles, permissions, and organizational policies to ensure secure and controlled access across the platform. It supports identity management, compliance, auditing, and centralized administration while maintaining data security, governance standards, and efficient collaboration between teams.

6. Metrics and Application Analysis Dashboard

The **Metrics & Operations** section provides tools to monitor application performance, usage, and overall system health while supporting day-to-day administration. It offers insights through analytics and enables tasks such as logging, backups, API management, integrations, and maintenance. This helps ensure reliable performance, efficient operations, and continuous improvement of applications.

7. Billing and Subscription Management

The **Billing** section displays subscription details, plan information, resource usage, and account status. Users can monitor their current plan, view usage statistics, and upgrade their subscription when required. It helps organizations effectively manage their Zoho Creator subscription.

Key Observations & Learning Outcomes: -

1. Gained a clear understanding of the Zoho Creator low-code platform and its layered architecture for application development.
2. Learned how to create, customize, and manage business applications using visual drag-and-drop components with minimal coding.
3. Explored deployment features such as environments, mobile applications, and web portals for seamless application delivery.
4. Understood the importance of organization, governance, and role-based access control in maintaining application security.
5. Studied monitoring and operational features, including metrics, logs, integrations, and application management tools.
6. Observed that the low-code approach significantly reduces development time while improving productivity and scalability.
7. Developed practical knowledge of building, deploying, and managing enterprise applications efficiently using Zoho Creator.

Conclusion: -

The Zoho Creator Low-Code Platform provides an efficient and user-friendly environment for developing business applications with minimal coding effort. Its integrated features for application development, deployment, governance, and monitoring enable faster development while ensuring scalability, security, and reliability. Overall, Zoho Creator is a powerful low-code solution that helps organizations accelerate digital transformation and simplify application lifecycle management.
