EXPERIMENT 9

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator — Event Registration Application

Name: Manishaa K | Roll Number: 241401051

Title

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator – Event Registration Application.

Aim

Toexplore the built-in analytics, dashboard charts and report display options of the Event Registration application in Zoho Creator, and to check the availability of AI-assisted (Zia) features in the account.

Objectives

- To observe and map the dashboard layout: KPI cards, charts and the All Event Registrations report.
- To record the dashboard figures (Total Registrations and Target Capacity Achieved).
- To study the column chart (Participant Type) and the donut chart (Event Track).
- To identify the built-in display formats available for a report through the Show As menu, and to view the records as a Kanban board.
- To audit the account for Zia AI assistance and record its limitations.

Software / Tools Required

- Zoho Creator(web-basedlow-code application development platform)
- Event Registration application created in Zoho Creator
- Web browser with an active internet connection
- Zoho account with access to the application

Introduction / Theory

AI-Assisted Features and Zia

AI-assisted features in a low-code platform help users build applications and understand their data with less manual effort, for example by generating insights, answering questions about data or suggesting application elements. ***Zia*** is the artificial-intelligence assistant of the Zoho ecosystem. Whether and where Zia options appear in Zoho Creator depends on the edition, the plan of the account and the interface version.

Built-in Analytics and Dashboards

Zoho Creator provides built-in analytics through pages and dashboards, which present application data visually without external tools. A dashboard combines several components on one page so that the status of the application can be understood at a glance.

Component	*Purpose*
KPI cards	Display a single key figure, such as a total or a percentage.
Charts	Represent data graphically, for example column charts for comparison between categories and donut (pie) charts for proportional distribution.
Reports	Present the records of a form in a structured manner, with a column for each field.
Interactive visualizations	Respond to user actions such as hovering, which shows the exact value of a bar or segment.

241401051

Report Display Formats

A report can be shown in more than one display format through the options menu of the report. The same records can be presented as a list, on a calendar, along a timeline, in a spreadsheet layout or as a Kanban board of cards grouped into lanes.

Procedure

1. Open Zoho Creator and sign in. The home page lists the available applications.

2. Open the ***Event Registration*** application and select ***Access this application*** to open it in its live (application) view.

3. Observe the dashboard. It contains the ***All Event Registrations*** report (columns Participant Name, Participant Type, Team Size, Email Address, Contact Number, College Organization Name and Institution Address), the KPI cards ***Total Registrations*** and ***Target Capacity Achieved***, a column chart titled Participant Type and a donut chart for Development Track and Cybersecurity Track.

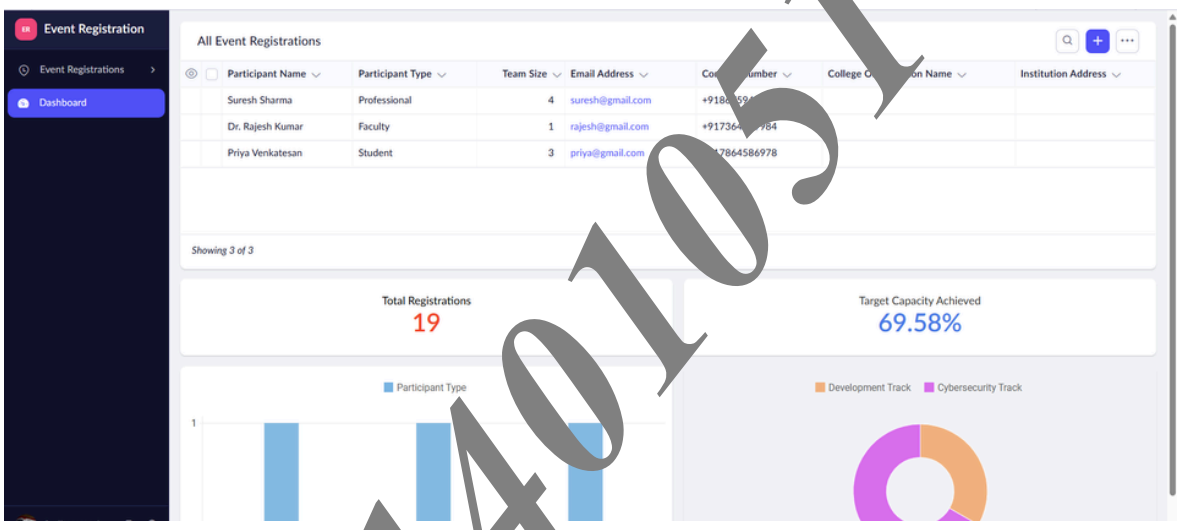

Figure 9.1: Event Registration Dashboard with Built-in Analytics

4. Examine the KPI cards and record the values displayed: Total Registrations – ***19*** and Target Capacity Achieved – ***69.58%***.

5. Examine the column chart, which shows the Participant Type distribution for the Student, Faculty and Professional records, and the donut chart, which shows the proportion of the Development Track and Cybersecurity Track.

6. Open the options menu (three dots) at the top-right corner of the All Event Registrations report. The menu lists the display options ***List*** (ticked, the format in use), ***Calendar***, ***Timeline***, ***Spreadsheet***, ***Kanban*** and ***Map***, together with Print. The menu is only viewed here.

241401051

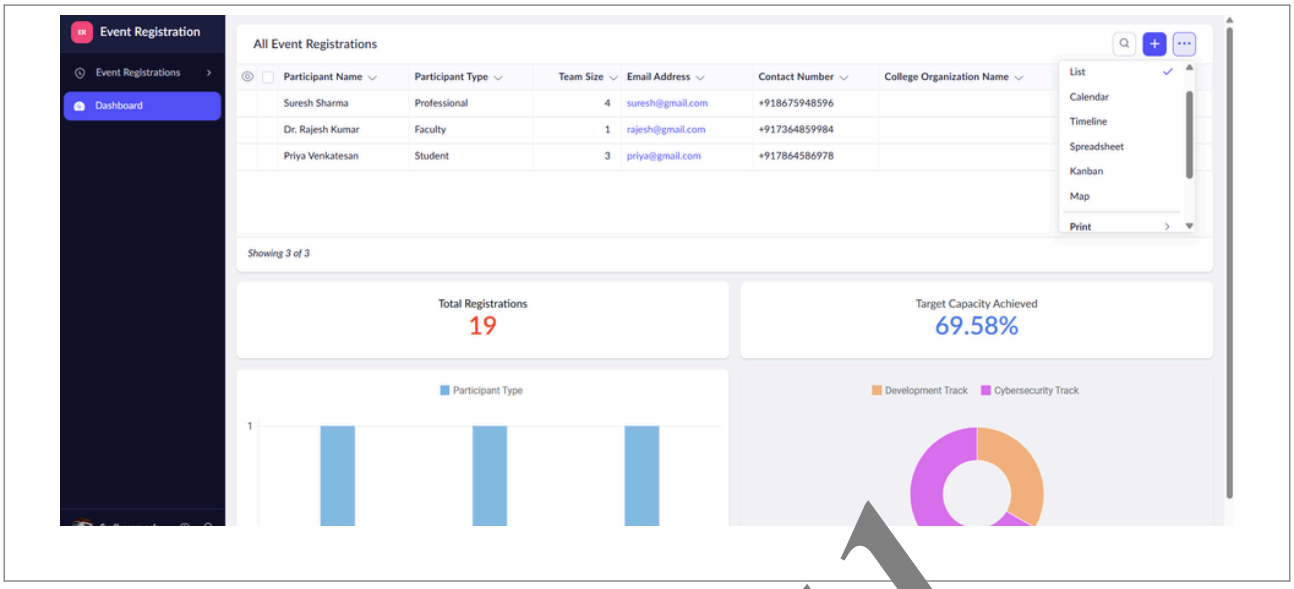

Figure 9.2: Show As Report Layout Options Menu of the All Event Registrations Report

7. Select the ***Kanban*** layout. The records are shown as cards in lanes, here grouped by Participant Type: ***Student*** (Priya Venkatesan), ***Faculty*** (Dr. Rajesh Kumar) and ***Professional*** (Suresh Sharma).

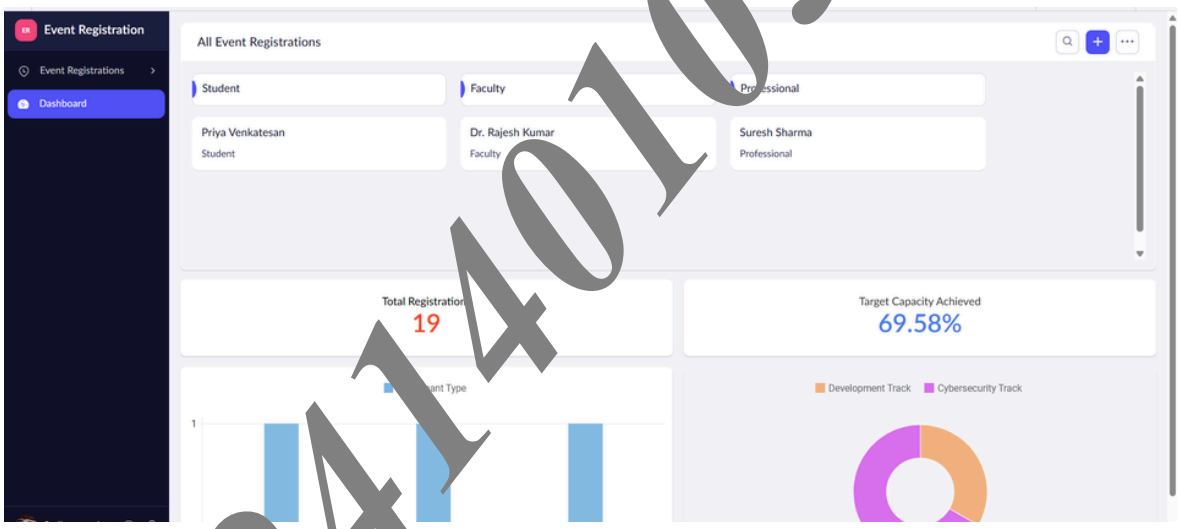

Figure 9.3: Kanban Board Grouped by Participant Type

8. Group the Kanban board by the technical event track. The lanes are ***AI & Data Science Track***, ***Development Track*** and ***Cybersecurity Track***. The AI & Data Science Track lane displays "No Records in AI & Data Science Track"; the Development Track lane holds one card (Dr. Rajesh Kumar – Faculty); the Cybersecurity Track lane holds two cards (Suresh Sharma – Professional and Priya Venkatesan – Student).

241401051

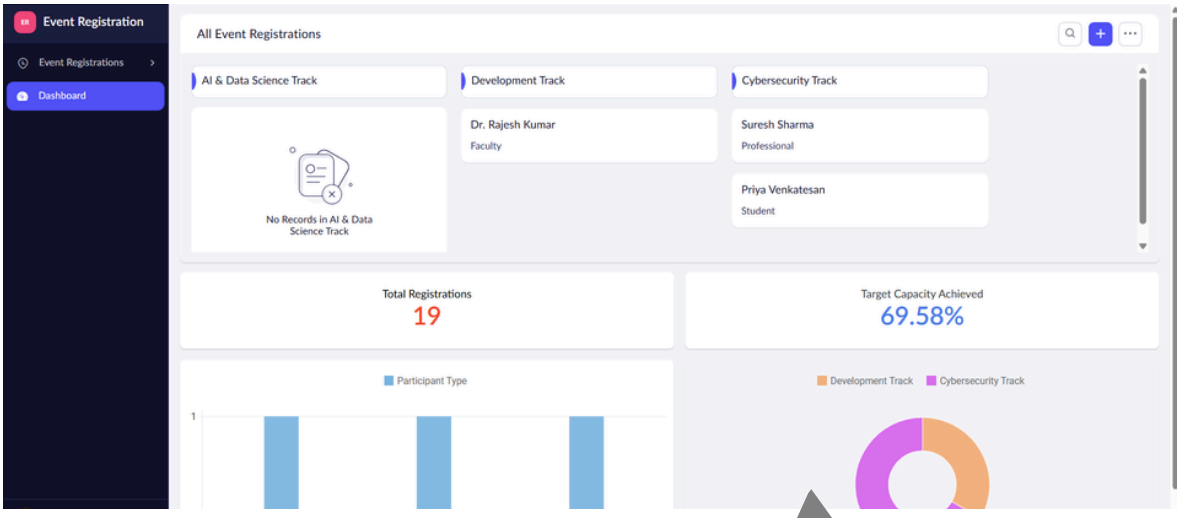

Figure 9.4: Active Technical Track Kanban Board

9. Check the application for Zia / AI-assisted options. The account header shows "Trial expires in 7 days" with an Upgrade option, and no Zia AI analytics feature was used or available in this account (see the Zia Audit below).

Dashboard Analytics

The values displayed on the dashboard are recorded below.

Dashboard Item	*Value Displayed*
Total Registrations (KPI card)	19
Target Capacity Achieved (KPI card)	69.58%
Records listed in All Event	3 ("Showing 3 of 3")
Registrations Column chart	Participant Type – Student, Faculty, Professional
Donut chart	Event Track – Development Track and Cybersecurity Track

Records visible in the All Event Registrations report:

Participant Name	*Participant Type*	*Team Size*	*Email Address*	*Contact Number*
Suresh Sharma	Professional	4	suresh@gmail.com	+918675948596
Dr. Rajesh Kumar	Faculty	1	rajesh@gmail.com	+917364859984
Priya Venkatesan	Student	3	priya@gmail.com	+917864586978

Kanban Board Layout (grouped by Technical Event Track)

Lane	*Cards*	*Participant Card(s)*
AI & Data Science Track	0	"No Records in AI & Data Science Track"
Development Track	1	Dr. Rajesh Kumar – Faculty
Cybersecurity Track	2	Suresh Sharma – Professional; Priya Venkatesan – Student

The same records grouped by Participant Type fall into three lanes with one card each: Student (Priya Venkatesan), Faculty (Dr. Rajesh Kumar) and Professional (Suresh Sharma). The donut chart is consistent with the Kanban board: the Cybersecurity Track segment is about twice the size of the Development Track segment, matching two cards against one.

241401051

Report Display Options

Option	*General Description*	*Observation*
List	Records as rows in a tabular list.	Ticked; format in use
Calendar	Places records on a calendar by a date field.	Listed in menu
Timeline	Arranges records chronologically.	Listed in menu
Spreadsheet	Grid layout similar to a spreadsheet.	Listed in menu
Kanban	Cards grouped in lanes by a field.	Listed; viewed in Figures 9.3 and 9.4
Map	Plots records on a map by location.	Listed in menu

System Architecture and Zia Audit

The built-in analytics areservedbythe application layer itself: the form stores the registrations, the report presents them in several display formats, and the dashboard page combines KPI cards, charts and the report into one view without any external software. These components responded correctly: the KPI cards displayed 19 and 69.58%, both charts rendered, and the report switched between its List and Kanban layouts.

For the Zia audit, the account header shows the trial banner with an ***Upgrade*** option (“Trial expires in 7 days”). Zia AI assistance was not used, configured or demonstrated in this experiment, and no AI-generated insights were obtained. Advanced AI-assisted capability depends on the edition and plan of the account, so it is treated here as a licensing-dependent limitation, while the built-in dashboard and reporting features described above operate fully in the current account.

241401051

Result

Thefollowing were successfully carried out in the Event Registration application:

- The dashboard KPI values (Total Registrations 19, Target Capacity Achieved 69.58%) were observed.
- The Participant Type column chart and the Development Track / Cybersecurity Track donut chart were examined.
- The built-in report display options (List, Calendar, Timeline, Spreadsheet, Kanban and Map) were identified in the options menu.
- The records were viewed as Kanban boards grouped by Participant Type and by Technical Event Track (AI & Data Science: 0, Development: 1, Cybersecurity: 2).
- The account was audited for Zia AI assistance; it was not used in this experiment.

Conclusion

The experimentdemonstrated the built-in analytics of Zoho Creator through the Event Registration application. KPI cards summarise key figures, charts show the distribution of participants by type and by track, and the report options menu offers several formats for viewing the same data. With a single selection the tabular list of registrations became a Kanban board of cards grouped by technical track, so event organisers can monitor registrations and spot empty tracks without exporting data to a spreadsheet or using any external software. These low-code reporting features therefore streamline event monitoring. The Zia / AI-assisted functionality was not used in the current account, so the practical work covered the built-in dashboard analytics, charts and report-view options.
